

ABSTRACT OF THE DISCLOSURE

In a circuit module package arranged on a mounting board, a circuit module has signal input and output terminals and is mounted on an interposer. The
5 interposer is provided with first signal terminals electrically connected to the signal input and output terminals of the circuit module, second electric terminals for electrically connecting the circuit module to the mounting board, internal wirings
10 electrically connected to the first signal terminals, and first coupling parts electrically connected to the internal wirings. An interface module is provided with a signal transmission line for transmitting the signals and second coupling parts electrically connected to the
15 transmission line. The second coupling part is electrically and mechanically connected to the first coupling parts, respectively.
